PhD in Political Economy & Government (PEG)

PhD in Public Policy (PPOL)
The PhD in Political Economy & Government (PEG) and PhD in Public Policy (PPOL) programs provide rigorous academic training to students who are committed to making the world a better place through research that inspires new ideas.

The PEG Program equips doctoral students for careers either in academia or policymaking that demand advanced knowledge of economics and political science. The PPOL Program trains doctoral students to shape new directions in public policy research and prepares them for careers in academia, government, and research organizations. PPOL students develop skills to teach the next generation of educators, researchers, and practitioners in public policy and the social sciences.

Students in both programs share an intellectual interest in the impact of politics on economic processes and outcomes, the reciprocal influence of economic conditions on political life, and developing scholarly research that empowers public policy practitioners to make informed decisions.

This document provides some of the students’ publications and presentations over the past year.
Political science is in large part the study of power, but power itself is difficult to measure. We argue that we can use newspaper coverage—in particular, the relative amount of space devoted to particular subjects in newspapers—to measure the relative power of an important set of political actors and offices. We use a new dataset containing nearly 50 million historical newspaper pages from 2,700 local U.S. newspapers over the years 1877-1977. We define and discuss a measure of power we develop based on observed word frequencies, and we validate it through a series of analyses. Overall, we find that the relative coverage of political actors and of political offices is a strong indicator of political power for the cases we study. To illustrate its usefulness, we apply the measure to understand when (and where) state party committees lost their power. Taken together, the paper sheds light on the nature of political news coverage and offers both a new dataset and a new measure for studying political power in a wide set of contexts.

**Abstract:** This paper explores the results of the 2016 parliamentary election in the Slovak Republic, with a special emphasis on the regional aspects of participating political parties’ election campaigns. It summarizes the election results for the country as a whole as well as separately by region. An empirical analysis of party electoral performance at the district level suggests that the incumbent Smer party tended to do well in districts with higher rates of unemployment and a lower proportion of university-educated population. Similar patterns hold for the Slovak ethnic nationalist Slovak National Party and the far-right People’s Party Our Slovakia. By contrast, the two parties that presented themselves as being starkly opposed to the Smer government’s policies—Freedom and Solidarity and Ordinary People and Independent Personalities—exhibit greater support in districts with more university-educated voters and lower unemployment rates.

**Abstract:** This article introduces TableMaker, an Excel macro that produces publication-quality tables and includes them as new sheets in workbooks. The macro provides an intuitive graphical user interface that allows for the full customization of all table features. It also allows users to save and load table templates, and thus allows layouts to be both reproducible and transferable. It is distributed in a single computer file. As such, the macro is easy to share as well as accessible to even beginning and casual users of Excel. Since it allows for the quick creation of reproducible and fully customizable tables, TableMaker can be very useful to academics, policy-makers, and businesses by making the presentation and formatting of results faster and more efficient.

**Abstract:** This article introduces the R package ExtremeBounds to perform extreme bounds analysis (EBA), a sensitivity test that examines how robustly the dependent variable of a regression model is related to a variety of possible determinants. ExtremeBounds supports Leamer’s EBA that focuses on the upper and lower extreme bounds of regression coefficients as well as Sala-i-Martin’s EBA, which considers their entire distribution. In contrast to existing alternatives, it can estimate models of a variety of user-defined sizes, use regression models other than ordinary least squares, incorporate non-linearities in the model specification, and apply custom weights and standard errors. To alleviate concerns about the multicollinearity and conceptual overlap of examined variables, ExtremeBounds allows users to specify sets of mutually exclusive variables, and can restrict the analysis to coefficients from regression models that yield a variance inflation factor within a prespecified limit.
Abstract: Selecting competent and motivated public sector workers is one of the major goals, and challenges, of both developed and developing economies. Understanding the frictions in the process through which the government selects applicants for a public sector job is therefore crucial to ensure the presence of a well-functioning bureaucracy. Patronage—the appointment of political supporters to government jobs—is often considered the leading friction in this selection process.

In this paper, we provide causal estimates of the importance of patronage in public sector employment, using a novel dataset on the universe of public sector workers in Brazil for the period 1997-2014 to follow the labor market careers of more than 2,000,000 political supporters, namely local political candidates and campaign donors. We use a regression discontinuity design that leverages very competitive municipal elections to identify the causal impact of being aligned to the party in power on individual careers in the public sector. We find that being a political supporter of the ruling party leads to a significant increase in the probability of having a public sector job.

Strikingly, the presence of patronage is significant throughout the entire public sector hierarchy, from leadership and managerial positions to more elementary occupations as front-service providers. We find that patronage leads to the selection of less educated and lower-quality public sector workers. The supporters who benefit the most from their political connections are less educated and have lower ability, but have contributed more money or brought more votes to their party.
