Advanced Quantitative Methods I (API-209)
Harvard Kennedy School
Course Syllabus – Fall 2019
Final Version

Faculty: Dan Levy
Office: Rubenstein 136
Phone: (617) 496-4281
E-mail: dan_levy@harvard.edu

Faculty Assistant: Victoria Barnum
Office: Rubenstein 121C
Phone: (617) 998-1590
E-mail: victoria_barnum@hks.harvard.edu

Key people:
Teaching Fellow: Jose Ramon Morales: jrm488@g.harvard.edu
R Fellow: Shiro Kuriwaki: kuriwaki@g.harvard.edu
Course Assistants: David Franklin: david_franklin@student.hks.harvard.edu
Sophie Gardiner: sophie_gardiner@student.hks.harvard.edu
Catrihel Greppi: catrihel_greppi@student.hks.harvard.edu

Course Description:
The goal of this course is to prepare you to analyze public policy issues using statistics. Key topics in the course are in the areas of probability theory, sampling, estimation, hypothesis testing, and regression analysis. While many students taking this class will have already taken courses in statistical inference and regression analysis, this course will place a much stronger emphasis than typical courses on conceptually understanding the underlying methods. Since the course is targeted to first-year students in the MPA-ID program, we will not shy away from using mathematical tools, but the emphasis of the course will be on the conceptual understanding and application of the tools rather than on the math or the mechanics behind the tools. So for example, when studying hypothesis testing, we will place a heavier emphasis on what the test is doing, when to use it and how to interpret its results, than on mathematical proofs underpinning the test or on mechanical repetitions of the calculations involved in conducting the test.

The ultimate goal is that by the end of this course you will be able to:
1. Conceptually understand the statistical methods studied in the course and be able to apply them to a wide range of public policy issues.
2. Interpret the results of statistical analyses and think critically about the potential issues that arise when trying to draw conclusions from such results.
3. Conduct statistical analyses using Excel and a statistical package called R.

Class Meetings:
Classes: Tuesdays and Thursdays, 1:15 pm – 2:30 pm, Wexner 436.
Review sessions: Session #1: Fr 1:15 pm - 2:30 pm, L280
Session #2: Fr 2:45 pm - 4:00 pm, L280
[You only need to attend one session]

Office Hours:
Fridays, 2:30 – 5:00, R136. (Sign-up sheet posted on office door)
Office hours for TF and CAs will be posted on the Canvas course website.
Prerequisites:
The main prerequisite for this course is an understanding of calculus at the level of a typical undergraduate calculus course. However, as far as mathematics goes, the most important prerequisite is a certain level of “mathematical sophistication,” i.e. comfort in dealing with mathematical constructs and arguments. Experience with computer programming is helpful.

Target Students:
This course is required for first-year students in the MPA/ID program. Students not in the MPA/ID program will be admitted only with permission of the instructor. Familiarity with the concepts indicated in the background section of the schedule (last column of table below) will be assumed. Students looking for a more mathematical course should consider EC2110 and EC2140 (offered by the Economics Department). Students looking for a less mathematical course should consider API-201 and API-205 (both offered here at HKS). Here is a draft list of other stats courses you could take at Harvard (put together last year by students in the PhD in Health Policy program).

Note: In general, I strive to welcome to the class non-MPA/ID students for whom API-209 is the best option. But unfortunately, I can only accept a limited number of students. Hence, unless you have compelling reasons to take this particular course, I suggest you consider taking another course.

Texts and Other Course Materials:

Key Recommended Textbook:

Background Textbooks:
- *Mathematical Statistics with Applications*, by Wackerly, Mendenhall and Scheaffer, Duxbury, Seventh Edition, 2008. [WMS]. This textbook is mainly for the first half of the course. Recommended if you do not already have a good mathematical statistics textbook.
- *Probability and Statistics*, by DeGroot and Schervish, Addison Wesley, Fourth Edition, 2012: This textbook is similar to WMS both in style and mathematical sophistication, but is organized slightly differently.

Note: All the textbooks listed above are available at the HKS library and some at the Coop.

R: We will be using R as the statistical software for the course. Here are some resources that might be helpful: [Summer Letter explaining use of R](#) | [Textbook](#) | [Cheat Sheet](#).

Handouts:
Handouts will be distributed throughout the course. The main objective of the handouts is to facilitate the process of taking notes so that you can fully engage in class. They are not meant to substitute for class attendance or for studying the assigned reading material. Handouts will contain blank spaces for you to fill in during class, usually in response to questions.

Course website:
Course materials will be posted on the Canvas course website for API-209. The link is here: [https://canvas.harvard.edu/courses/62311](https://canvas.harvard.edu/courses/62311).
Grading:
The class grade will be based on the following criteria:
- 10% - Problem sets
- 15% - Class participation and engagement
- 15% - Final Exercise
- 25% - Midterm exam
- 35% - Final exam

Problem Sets (10%)
Problem sets will be assigned almost every week. They will give you hands-on experience with the analytic techniques introduced in class. You should plan to spend approximately 8-10 hours on each problem set. Problem sets will be posted on the course website, as will suggested answers. They will be graded on a three-point scale:
- 3 points = check-plus
- 2 points = check
- 1 point = check-minus

Problem sets not received by the deadline will be considered late. There will be no credit for late assignments. The lowest problem set grade will be dropped when calculating the average grade for the problem sets.

We abide by the Harvard Kennedy School Academic code (available here) for all aspects of the course. In terms of problem sets, unless explicitly written otherwise, the norms are the following: You are free (and encouraged) to discuss problem sets with your classmates. However, you must hand in your own unique written work and code in all cases. Any copy/paste of another’s work is plagiarism. In other words, you can work with your classmate(s), sitting side-by-side and going through the problem set question-by-question, but you must each type your own answers and your own code. Your answers may be similar (obviously) but they must not be identical, or even identical ‘ish. Violations of the Academic Code are a serious violation of academic and professional standards and can lead to a failing grade in the course, failure to graduate, and even expulsion from the University. I take this issue seriously. If you have questions about the degree of collaboration allowed or about any other aspect of the Academic Code, please come to see me.

Instructions for submitting problem sets:
- Turn them in electronically via the Canvas course page.
- Submit them by 10:10 am on the day they are due. Assignments submitted after class begins will be considered late.
- Indicate on the cover page the names of the classmates you worked with.

Class participation and engagement (15%)
This component of the grade is meant to reward the things you do to contribute to your own learning and to the learning of your classmates. Below are some of the key vehicles for doing so in this course. For all these, both quantity and quality will count.

- **Engagement in class:** I strongly believe that student participation can substantially enrich the learning experience for both the students and the instructor. In this spirit, you are encouraged to ask questions and to share with the class any relevant insights you may have from your work experience or from previous exposure to the topic at hand. Effective class participation requires that you come prepared for class, and that you think about how your comment or question may enrich the learning experience of your classmates. I also ask that the questions and comments be brief and related to the topic being discussed. Given that this is a large class, I will sometimes need to defer questions for a future class or office hours. A strong engagement in class also means attending class regularly and punctually, engaging actively in both classwide and small group activities, and in general contributing to a positive learning atmosphere in the classroom.
• **Engagement outside of class:** A key goal of the course is to help you use statistical tools in the real world. Hence, I encourage you to make connections between the tools we study in class and things you encounter outside of the classroom using the discussion board of the course website. We will also make Twitter (#api209) an option for course participation. Examples of such postings include references to news articles, a report that you worked on before coming to the Kennedy School, reflections on connections with things you have studied in your other core courses, or perhaps some event or controversy in which statistics is playing a key role. You can contribute both by starting a discussion and by moving it forward. Finally, you are encouraged to challenge one another’s thinking and to debate conflicting perspectives.

**Final Exercise (15%)**
The final exercise will require applying some of the statistical tools learned in class using a real data set. More details will be provided later in the course.

**Midterm Exam (25%):**
Please note that midterm exam will be held on **Friday**, Oct 11, from 8:00 AM to 10:00 AM. It will be a two-stage exam (see details below).

**Final Exam (35%):**
Please note that final exam will be held on **Dec 19**, from 9:00 AM to 12:00 PM. It will also be a two-stage exam (see details below).

Two-stage exams: The midterm and final exams will be two-stage exams. During Stage 1, you will be asked to complete the exam individually. After Stage 1, the exams will be collected and you will be given a second exam that will contain a subset of the questions from the original exam. During Stage 2, you will be asked to work with a group, reach consensus answers, and submit one copy of the exam for the whole group. If your group grade is higher than your individual grade for that subset of questions, your grade for those questions will be 90% of your Stage 1 score plus 10% of your Stage 2 score. If your Stage 2 grade is lower than your Stage 1 grade, we will not incorporate Stage 2 into your score and your exam grade will simply be your Stage 1 grade.

The main reason we conduct a second stage of the exam is to allow you to learn more during the exam. Traditional exams tend to be summative rather than formative, and two-stage exams represent an opportunity to redress this imbalance. The process of discussing your answers with your teammates is a significant learning opportunity and supports the kind of collaborative learning that we encourage.

**Regrade Policy**
Requests for reconsideration of grades on exams are not encouraged, and will be accepted only in writing, with a clear statement of what has been incorrectly graded, and within one week of receiving your graded exam. Please submit your full exam so grading on all questions can be reconsidered.

All course activities, including class meetings, problem sets, and exams are subject to the HKS Academic Code and Code of Conduct.

**Letter Grades**
Grades for each exam and for each component of the course (problem sets, final exercise, and class participation and engagement) will be standardized (i.e. curved) and then an overall score for the course will be calculated for each student. This overall score will be translated into a final course letter grade using the Dean’s Recommended Grade Distribution (available [here](#)).
Other items:

**Recording Classes**
Classes will be video-recorded, and recordings will be available for two purposes. First, to provide you with the option of reviewing the class so you can clarify or deepen your understanding of a particular concept. Second, to help me improve my teaching. The recordings will be kept in a protected page that is accessible to you only via the course site. As a member of our learning community and to stimulate risk-taking and vigorous debate in class, you are expected to never make any recordings available outside of our learning community. If you are uncomfortable with classes being recorded, please come and speak with me.

**Use of Data**
Data will be collected in various forms in this course. Some forms of data collection will be obvious to you (such as when responding to a question on a survey) but others might not be (such as someone from our teaching team records class participation or the Canvas course website system recording activity while you are logged in). Whatever the form of data collection, I pledge to use the data to help improve my teaching and ultimately your learning. This includes using your responses to online quizzes to tailor a class better to the backgrounds and learning needs of students in the class, conducting research about the effectiveness of a particular teaching approach, etc. I also pledge to keep your data confidential so that it can only be used for the purposes of improving teaching and learning or to help you and other students connect with future professional opportunities.

**Teachly**
I strive to teach in a classroom in which everyone feels welcome to participate in class. To help me get to know you better, keep track of classroom participation patterns and create an inclusive classroom environment, I will be using a tool developed by faculty and students at the Harvard Kennedy School called Teachly. [Here](#) is a link to a list of Frequently Asked Questions about Teachly.

**Tentative Schedule:**

Tentative schedule is attached. Adjustments may need to be made and will be communicated as soon as they are available. W refers to readings from Wooldridge. For a refresher on the concepts indicated in the background section of the schedule (last column of table below), see Deb Hughes Hallett's excellent handouts (click on "Math Camp" link here: [https://canvas.harvard.edu/courses/62068](https://canvas.harvard.edu/courses/62068)).

**READINGS**

Stokey and Zeckhauser, A Primer for Policy Analysis, *Chapter 12*

The Economist, “Signifying Nothing?” January 31, 2004

**CASES**

Case 2011.0: Providing Pensions for the Poor: Targeting Cash Transfers for the Elderly in Mexico

HBS Case 9-68-019: Improving Worker Safety in the Era of Machine Learning, Case A.
